

Solitary Vireo; in both of these instances, however, the bird, unlike the Solitary above mentioned, appeared to use only the song which it had borrowed from its near relative and to have either lost or never acquired that of its own species.—WILLIAM BREWSTER, *Cambridge, Mass.*

Bell's Vireo (*Vireo bellii*) in Colorado. — It may be of interest to record that the writer shot a male Bell's Vireo, June 12, 1903, on Clear Creek, near Denver, Colorado. In his second appendix to the 'Birds of Colorado,' Prof. W. W. Cooke intimates the future discovery of the species in the State, and so far as I know this is the first taken in Colorado. The bird was first discovered by hearing its unfamiliar song, but I feel quite certain I have heard the same song in the city, on one or two occasions in previous years. The specimen is now in the collection of the State Historical and Natural History Society, Denver, Colo. — HORACE G. SMITH, *Asst. Curator, State Historical and Natural History Society, Denver, Colorado.*

Nest and Eggs of the Swainson's Warbler (*Helinaia swainsonii*). — June 1st and 8th were 'red-letter' days for me from an oölogical standpoint. Jumping on my wheel and riding two or three miles from this city, I came to a swamp I had never visited before; and while looking carefully among the thick cane-brake, I heard *chips* of a warbler. Birds were singing and darting all around, and the 'swamp-flies' were making my life miserable, when I perceived a bunch of cane-leaves near the top of a cane-bush seven feet above the ground. On going closer, I saw a warbler on the nest, which immediately flushed and feigned lameness, rolling and chirping on the ground among the cane. I at once recognized the bird as Swainson's Warbler, and on peering into the nest saw, to my great delight, three white, unmarked eggs of a slightly pinkish hue and rather globular in shape. The nest was a typical warbler's, being made of leaves of the elm, cane in layers, pine needles, and lined with fine rootlets and grasses. I at once packed the eggs with the enthusiasm of having found such a rare nest — the rarest eggs I have ever found in this locality. Having read that this specie of warbler nests in small colonies, I continued in the cane, stooping often to search the tops of the cane. I had not gone ten feet, when I came to another nest with a warbler on it, in a cane-bush situated five feet above the ground. The bird dropped and fluttered off. The nest was more compactly built and contained three fresh eggs, somewhat smaller than the eggs of the other set. Proceeding near the end of the cane-brake, I saw a warbler dart out from a clump of cane, and on investigating, I saw a neat little Hooded Warbler's (*Wilsonia mitrata*) nest with three creamy white eggs marked with specks and spots of chestnut and lilac gray wreaths. I found one uncompleted Swainson's Warbler's nest, and on visiting the same swamp again in a week, I located two more sets of three eggs each of this
